

Upper Murray Seeds®
Sow much better

Scientific Name

Lolium perenne

PRODUCT INFORMATION

Overview

A highly productive, late maturing, tetraploid ryegrass derived from a selection of Spanish and New Zealand germplasm.

- Late flowering tetraploid perennial ryegrass
- Produces excellent quality and highly palatable feed
- Fast to establish, impressive production in winter and spring
- Very persistent with remarkable dry matter production

Plant Characteristics

- Tetraploid perennial ryegrass
- Low endophyte levels
- Very palatable with high tiller density

Maturity

A late maturing plant designed to produce large amounts of dry matter well into summer (if conditions are suitable).

Area of Adaption

- Medium to high rainfall
- Performs very well under irrigation

Seed Size

200,000-300,000 seeds per kg

(Source: *Pasture Varieties used in NSW 2006-2007*, Bev Zurbo, 2006)

Sowing

Sow at a minimum of 25-30kg/ha alone or 15-20kg/ha when a component of a pasture blend. Munch is suited to oversowing run-down pastures or an established stand at a rate of 15-20kg/ha.

Sow seed no deeper than 1cm in a fine but firm seed bed. Sow into bared ground if direct drilling. Lightly harrow and roll to improve germination. Pasture productivity is directly related to successful plant establishment.

PRODUCT INFORMATION

Disease and Pest Management

During emergence it is essential to monitor regularly for damage from insects such as RLEM and lucerne flea, and spray as required. Inspect during early stand life for populations of black-headed cockchafer and slugs. Contact your Upper Murray Seeds agronomist for spray application rates.

Weed Control

Munch seedlings germinate quickly and are very competitive once established. Always use a knockdown herbicide to ensure you are sowing into a clean seedbed. Monitor for post-emergent weeds and spray as required. Use options such as spray-grazing for broadleaf weeds.

Grazing

Do not graze Munch until the plant is well anchored and root depth is established. Carry out a quick in-paddock 'grab test' by hand to ensure stock cannot pull plants out of the ground. Munch should be rotationally grazed to maintain 2-3 leaves per tiller. If the stand is allowed to grow beyond the three-leaf stage, it may run to head earlier and there will be a proportional reduction in quality and productivity.

Remove dry residues from established stands during autumn to encourage new tillers. Reduce stocking rates during late spring to encourage seed set and provide summer feed. Perennial ryegrass should be rested if temperatures exceed 30°C to reduce plant stress. Munch requires rotational grazing for persistence, high yields and to maintain nutritional quality.

Feed Quality

Tetraploid perennials provide good winter production. Munch is an excellent base for any perennial pasture providing reliable DM production.

Animal Health

To optimise livestock weight gain and health, ensure livestock are vaccinated and drenched. To prevent nutritional problems, make gradual diet changes when introducing hungry stock to lush pastures.

Munch contains some levels of wild endophyte and like any perennial ryegrass care must be taken grazing a short pick or mature seed heads. The high risk period is from late summer through to early autumn. Contact an Upper Murray Seeds agronomist for more information.
